

## Precision Sunwear Solutions

“recalculation will correct the aspherical deviation created by the wrap around curved design.

Standard eyewear has a face form of 6 degrees. The patient's visual orientation is based on this standard angle of vision. The wrap around curve design and 18-degree lens angle creates unwanted aspherical deviation. Every patented a741 insert prescription is recalculated to provide optimum visual performance for your patient. Vertex distance is the recalculation of the prescription, based on the distance between the eye and the lens only. Silhouette's Recalculation is the correction of the Rx for both the distance from the eye and the peripheral angle of variance.
